- Output Data: Logs, reports, and post-processing results.

Understanding the structure and purpose of this parent directory is crucial for both novice users and seasoned engineers, as it impacts project management, troubleshooting, and collaboration.

The Structural Anatomy of the Parent Directory

The parent directory typically follows a hierarchical structure designed to facilitate organized data management. While the exact structure can vary depending on user preferences and the complexity of projects, a standard layout includes:

- Root Project Folder
 - Main Project File (.wbproj): The entry point for the project, containing references to all associated files and settings.
 - Subfolders:
 - Geometry: Stores CAD files, sketches, or imported geometries.
 - Mesh: Contains mesh files generated during preprocessing.
 - Materials: Material property databases or custom material definitions.
 - Results: Post-processing outputs, images, and reports.
 - Logs: Execution logs, error reports, and debugging information.
 - Scripts: Automation scripts or macros used for repetitive tasks.
 - Configuration and Settings Files
 - Files that store user preferences, environment variables, or project-specific configurations.
 - External Data or Libraries

- If referenced, external datasets, libraries, or plugin files are stored within or linked to the parent directory.

This modular structure ensures that each aspect of a simulation?geometry, mesh, materials, results?is compartmentalized, promoting easy navigation and management.
