Understanding Robot Manipulators

What is a Robot Manipulator?

A robot manipulator is a mechanical arm designed to perform specific tasks by mimicking human arm movements. It comprises interconnected segments (links) joined by joints that allow movement in various degrees of freedom (DOF). Manipulators can be simple, with a few joints, or highly complex with numerous axes to perform intricate tasks.

Modelling of Robot Manipulators

Importance of Accurate Modelling

Effective control strategies depend heavily on precise models that describe the robot's kinematics and dynamics. Accurate modelling enables simulation, analysis, and improvement of robot performance.

Kinematic Modelling

Kinematic modelling involves describing the robot's geometry and motion without considering forces or masses.

Denavit-Hartenberg (D-H) Parameters

A systematic approach to model joint and link parameters:

- Link length (a): Distance between joint axes
- Link twist (?): Angle between axes
- Link offset (d): Distance along the previous z-axis
- Joint angle (?): Rotation about the z-axis

Using D-H parameters, the forward kinematics can be derived to compute the position and orientation of the end-effector.

Dynamic Modelling

Dynamic models describe how forces and torques influence the robot's motion.

Newton-Euler Formulation

A recursive method that computes joint torques based on link velocities, accelerations, and forces.

Lagrangian Formulation

$\mathcal{L}$

$$L = T - V$$

\]

where (L) is the Lagrangian, (T) is kinetic energy, and (V) is potential energy.

The equations of motion derived from the Lagrangian are expressed as:

\[

$$\frac{d}{dt} \left(\frac{\partial L}{\partial \dot{q}_i} \right) - \frac{\partial L}{\partial q_i} = \tau_i$$

\]

where (q_i) are joint variables, $(\dot{q}_i)$ are their derivatives, and (τ_i) are joint torques.
