Whether you're preparing for your first anatomy and physiology course or seeking to solidify your understanding before the final exam, this article offers valuable insights and organized information to enhance your study sessions. Let's delve into the core areas you need to master, including the skeletal system, muscular system, nervous system, cardiovascular system, respiratory system, digestive system, and more.

## Skeletal System

The skeletal system provides the framework for the body, supports movement, protects vital organs, and produces blood cells. Understanding its structure and function is crucial for your exam.

### Bone Anatomy

Bones are classified into various types based on their shape:

- **Long bones:** e.g., femur, tibia ? support weight and facilitate movement
- **Short bones:** e.g., carpals, tarsals ? provide stability and some movement
- **Flat bones:** e.g., skull, sternum ? protect internal organs
- **Irregular bones:** e.g., vertebrae, pelvis ? have complex shapes for specific functions

Each bone is composed of dense outer compact bone and a spongy inner bone called trabecular or cancellous bone, which contains marrow.

### Bone Cells and Remodeling

- **Osteoblasts:** build new bone tissue
- **Osteocytes:** mature bone cells maintaining bone tissue
- **Osteoclasts:** break down bone tissue

Bone remodeling is a continuous process that maintains calcium homeostasis and repairs

microdamage.

## Joints and Movement

Joints connect bones and facilitate movement:

- **Fibrous joints:** immovable, e.g., sutures of the skull
- **Cartilaginous joints:** slightly movable, e.g., intervertebral discs
- **Synovial joints:** freely movable, e.g., knee, shoulder

Synovial joints contain a synovial cavity, synovial fluid, and articular cartilage, enabling smooth movement.

### Types of Muscles

- **Skeletal muscles:** voluntary muscles attached to bones
- **Cardiac muscles:** involuntary muscles of the heart
- **Smooth muscles:** involuntary muscles found in walls of hollow organs

### Muscle Structure and Contraction

Muscle fibers contain myofibrils, composed of actin and myosin filaments. The sliding filament theory explains muscle contraction:

- Nerve impulse triggers release of calcium ions
- Calcium binds to troponin, allowing actin and myosin to interact
- Myosin heads pull on actin filaments, shortening the muscle fiber
- ATP provides energy for contraction and relaxation

### Major Muscle Groups

- Upper limb: biceps brachii, triceps brachii

- Lower limb: quadriceps femoris, hamstrings
- Core muscles: rectus abdominis, obliques, erector spinae

Understanding the function and location of these muscles aids in grasping movement mechanics.

## **Nervous System**

The nervous system controls and coordinates body activities, processes sensory information, and facilitates responses.

### **Neurons and Neuroglia**

- Neurons: transmit electrical impulses
- Neuroglia: support neurons (e.g., astrocytes, oligodendrocytes, Schwann cells)

### **Central and Peripheral Nervous Systems**

- Central Nervous System (CNS): brain and spinal cord
- Peripheral Nervous System (PNS): cranial and spinal nerves

The PNS is divided into somatic (voluntary control) and autonomic (involuntary control) divisions.

### **Neural Communication**

- Resting potential is maintained by sodium-potassium pumps
- An action potential is generated when depolarization reaches threshold

**Question** What are the main functions of the cardiovascular system? The main functions of the cardiovascular system include transporting nutrients, oxygen, and hormones to cells; removing waste products; maintaining blood pressure; and regulating body temperature. How does the structure of a neuron facilitate its function? Neurons have a cell body, dendrites, and an axon. Dendrites receive signals, the cell body processes information, and the axon transmits electrical impulses, allowing rapid communication throughout the body. What is the role of the respiratory system in maintaining homeostasis? The respiratory system maintains homeostasis by regulating the levels of oxygen and carbon dioxide in the blood, ensuring proper pH balance, and facilitating gas exchange in the lungs. Describe the process of muscle contraction at the cellular level. Muscle contraction involves the sliding filament theory, where myosin heads bind to actin filaments, pull them inward using ATP energy, causing the muscle to shorten and generate force. What are the major differences between the sympathetic and parasympathetic nervous systems? The sympathetic nervous system prepares the body for 'fight or flight' responses, increasing heart rate and dilating airways, while the parasympathetic nervous system promotes 'rest and digest' activities, slowing the heart rate and stimulating digestion. How do the kidneys contribute to homeostasis? The kidneys regulate fluid and electrolyte balance, remove waste products through urine, control blood pressure via the renin-angiotensin system, and help maintain acid-base balance. What is the significance of the structure of alveoli in the lungs? Alveoli are tiny sac-like structures with thin walls that provide a large surface area for efficient gas exchange between air and blood. Explain the role of hormones in the endocrine system. Hormones act as chemical messengers that regulate various physiological processes such as growth, metabolism, reproduction, and stress responses by targeting specific organs and tissues. What are the main components of the skeletal system and their functions? The skeletal system includes bones, cartilage, ligaments, and joints, providing support, protection for internal organs, enabling movement, and serving as a reservoir for minerals like calcium. How does the integumentary system help regulate body temperature? The integumentary system, primarily through the skin, sweat glands, and blood vessels, helps regulate temperature by sweating to cool the body and constricting blood vessels to conserve heat.
